Rental Rework, Inspection, Maintenance, and Repair Procedure for Universal Swift-Lifting Eye Hardware (P-50)

1.0 Scope

1.1 This document defines the procedure for plant inspection and maintenance for products returning from rental

2.0 Purpose

2.1 To receive and inspect all new and returning product to ensure that all units entering the Dayton Superior rental fleet inventory meet design specifications and are functional.
2.2 To check for worn or damaged parts
2.3 To establish preventive maintenance control and maintain historical records for maintenance activity.

3.0 Procedure

3.1 Inspect all lifting eyes after each return from field.
3.2 Check for evidence of heat applications. If evidence of heat application is present, scrap unit.
3.3 The upper limit of Dimension “H” and the lower limit of Dimensions “M”, “B”, and “DIA” are shown above. If either of these dimensions are exceeded, the unit must be removed from service and destroyed.
3.4 Check for bent or twisted bails. The bail must be allowed to rotate freely in all directions. Do not attempt to straighten. Discard units with bent or twisted bails.
3.5 Inspect bail for cracks and welds for cracks.
3.6 No repairs to SL Lifting Body or Arm are permitted
4.0 Proof Load Testing and Serialization:

4.1 All units must be proof loaded and serialized.
4.2 Any pre-existing units that have not been serialized will be recovered, load tested, inspected, and serialized.
4.3 If the unit has been previously serialized, review records upon return from customer to determine the date of the last load test and post load test inspection. If the test was performed more than 2 years prior, return the unit to an authorized facility for load test and inspection.
4.4 Stamp Hardware or attach proof load tag to show when unit was tested.
4.5 Document proof load test and inspection into log/database/etc.
4.6 Return unit to service.

5.0 Documentation
5.1 Locate Serial Number (XX-XXXX-XXX) on part. Log with repairs and/or comments on the Lift/Accessory Rental Repair Log.
