

T110 Base Plate

The **T110 Base Plate** is designed for use with the standard **T110 Lifting Insert** in insulated concrete panels. It expands the base of the insert, preventing it from sinking into the insulation during setup and the concrete pour. This ensures the insert remains at the correct height and is easy to locate after the concrete sets. Without the base plate, the insert can sink, making it difficult—or impossible—to find later, potentially requiring time-consuming and costly emergency lift plates.

Benefits

- **Prevents Piercing:** Stops the T110 insert from piercing the insulation
- **Reduces Emergency Lift Plates:** Minimizes or eliminates the need for emergency lift plates when the insert is lost due to sinking
- **Ensures Clean Finish:** Provides a clean finish once the concrete is set by maintaining the proper insert height
- **Eliminates Shims:** Removes the need for shims, saving time and ensuring proper lifting insert alignment
- **Maintains Insert Height:** Keeps the T110 insert at the correct height
